This edited book discusses the exciting field of Digital Creativity. Through exploring the current state of the creative industries, the authors show how technologies are reshaping our creative processes and how they are affecting the innovative creation of new products. Readers will discover how creative production processes are dominated by digital data transmission which makes the connection between people, ideas and creative processes easy to achieve within collaborative and co-creative environments. Since we rely on our senses to understand our world, perhaps of more significance is that technologies through 3D printing are returning from the digital to the physical world. Written by an interdisciplinary group of researchers this thought provoking book will appeal to academics and students from a wide range of backgrounds working or interested in the technologies that are shaping our experiences of the future. Rubin's STATISTICS FOR EVIDENCE-BASED PRACTICE AND EVALUATION has a proven ability to reach students and get them excited about--and see the relevance of--a course they often find intimidating. Presented in an authoritative yet humorous style, this text--designed specifically for statistics and evaluation courses in the helping professions--features cases, exercises, and many examples to bring the topic of statistics alive for student readers. As adults, we are all continually involved in learning, with increasing numbers of us engaged in more formalized forms of learning; that is, in education or training. All those involved in the broad field of adult education and training will come into contact with many specialist ideas or concepts. It is often assumed of students that they already have a general understanding of these concepts, their meanings, applicability and inter-relationships. This is not always the case. This book examines in detail over forty of these key concepts, ranging from community education and experiential learning to competence and access. It presents a clear, analytical discussion in jargon-free language. It is, therefore, indispensable to all students and practitioners of adult education and training.

This book advances an environmental approach to enhancing creativity in schools, by interweaving educational creativity theory with creative industries environmental approaches. Using Anna Craft's last book Creativity and Education Futures as a starting point, the book sets out an up-to-date argument

for why education policy should be supporting a birth-to-workplace approach to developing creative skills and capacities that extends across the education lifespan. The book also draws on the voices of school teachers, students and leaders who suggest directions for the next generation of creative teachers and learners in a rapidly evolving global education landscape. Overall, the book argues that secondary schools must find a way to make more room for creative risk, innovation and imagination in order to adequately prepare students for creative workplaces and publics.

This volume presents a practical guide to the development, application and evaluation of effective interprofessional education in health and social care. It is both a practice manual for those in hands-on roles and a reflective guide for those indirectly involved in professional education. The book provides clear advice on methods of establishing training and education programmes and evaluating their effectiveness, while simultaneously examining the relationship between initial application, ongoing maintenance and subsequent assessment. The authors expound multiple points of view that will generate individual thinking and approaches to both the practice and the estimation of interprofessional education schemes. The book is divided into three sections: the first introduces the differing approaches to professional education and the rationale behind measuring their worth; the second part focuses on planning, development and delivery; the third part advises in a robust and pragmatic way on modes of measuring the efficacy of programmes. The interrelation of these topics is then examined to provide a synthesised perspective on the development, delivery and evaluation of interprofessional education.

Do your students ever struggle to grasp what exactly constitutes evidence or struggle to see how it applies to practice? Would you like them to feel more confident about critiquing evidence? The need for an evidence base for nursing practice is widely accepted. However, what constitutes evidence and how nurses might apply it to practice is not always clear. This book guides nursing students through the process of identifying, appraising and applying evidence in nursing practice. It explores a wide range differing sources of evidence and knowledge, and helps students to develop key skills of critiquing research and using evidence in clinical decision making.

Explaining Creativity is an accessible introduction to the latest scientific research on creativity. In the last 50 years, psychologists, anthropologists, and sociologists have increasingly studied creativity, and we now know more about creativity than at any point in history. Explaining Creativity considers not only arts like painting and writing, but also science, stage performance, and business innovation. Until about a decade ago, creativity researchers tended to focus on highly valued activities like fine art painting and Nobel prize winning science. Sawyer brings this research up to date by including movies, music videos, cartoons, videogames, hypertext fiction, and computer technology. For example, this is the first book on creativity to include studies of performance and improvisation. Sawyer draws on the latest research findings to show

the importance of collaboration and context in all of these creative activities. Today's science of creativity is interdisciplinary; in addition to psychological studies of creativity, Explaining Creativity includes research by anthropologists on creativity in non-Western cultures, and research by sociologists about the situations, contexts, and networks of creative activity. Explaining Creativity brings these approaches together within the sociocultural approach to creativity pioneered by Howard Becker, Mihaly Csikszentmihalyi and Howard Gardner. The sociocultural approach moves beyond the individual to consider the social and cultural contexts of creativity, emphasizing the role of collaboration and context in the creative process.

Over the past century, educational psychologists and researchers have posited many theories to explain how individuals learn, i.e. how they acquire, organize and deploy knowledge and skills. The 20th century can be considered the century of psychology on learning and related fields of interest (such as motivation, cognition, metacognition etc.) and it is fascinating to see the various mainstreams of learning, remembered and forgotten over the 20th century and note that basic assumptions of early theories survived several paradigm shifts of psychology and epistemology. Beyond folk psychology and its naïve theories of learning, psychological learning theories can be grouped into some basic categories, such as behaviorist learning theories, connectionist learning theories, cognitive learning theories, constructivist learning theories, and social learning

theories. Learning theories are not limited to psychology and related fields of interest but rather we can find the topic of learning in various disciplines, such as philosophy and epistemology, education, information science, biology, and - as a result of the emergence of computer technologies - especially also in the field of computer sciences and artificial intelligence. As a consequence, machine learning struck a chord in the 1980s and became an important field of the learning sciences in general. As the learning sciences became more specialized and complex, the various fields of interest were widely spread and separated from each other; as a consequence, even presently, there is no comprehensive overview of the sciences of learning or the central theoretical concepts and vocabulary on which researchers rely. The Encyclopedia of the Sciences of Learning provides an up-to-date, broad and authoritative coverage of the specific terms mostly used in the sciences of learning and its related fields, including relevant areas of instruction, pedagogy, cognitive sciences, and especially machine learning and knowledge engineering. This modern compendium will be an indispensable source of information for scientists, educators, engineers, and technical staff active in all fields of learning. More specifically, the Encyclopedia provides fast access to the most relevant theoretical terms provides up-to-date, broad and authoritative coverage of the most important theories within the various fields of the learning sciences and adjacent sciences and

communication technologies; supplies clear and precise explanations of the theoretical terms, cross-references to related entries and up-to-date references to important research and publications. The Encyclopedia also contains biographical entries of individuals who have substantially contributed to the sciences of learning; the entries are written by a distinguished panel of researchers in the various fields of the learning sciences.

At the very heart of modern healthcare is a critical paradox. Today, as never before, healthcare has the ability to enhance the quality and duration of life. At the same time, healthcare has become so enormously costly that it can easily bankrupt governments and impoverish individuals and families. According to federal forecasters, by the year 2015 one in every five U.S. dollars will be spent on healthcare, for total annual healthcare spending of more than \$4 trillion. While the cost of healthcare is going up, the number of individuals and families without health insurance coverage is increasing. For many, the miracles of modern medicine may be unaffordable. Health services research investigates the relationship between the factors of cost, quality, and access to healthcare and their impact upon medical outcomes (i.e., death, disease, disability, discomfort, and dissatisfaction with care). Health services research addresses such key questions as, Why is the cost of healthcare always
